Information about Copyrighted Content

Some instruments administered as part of this study may contain in whole or substantially in part contents from copyrighted instruments. Reproductions of the instruments are provided as documentation for the analysis of the data associated with this collection. Restrictions on "fair use" apply to all copyrighted content. More information about the reproduction of copyrighted works by educators and librarians is available from the United States Copyright Office.

NOTICE
WARNING CONCERNING COPYRIGHT RESTRICTIONS

The copyright law of the United States (Title 17, United States Code) governs the making of photocopies or other reproductions of copyrighted material. Under certain conditions specified in the law, libraries and archives are authorized to furnish a photocopy or other reproduction. One of these specified conditions is that the photocopy or reproduction is not to be "used for any purpose other than private study, scholarship, or research." If a user makes a request for, or later uses, a photocopy or reproduction for purposes in excess of "fair use," that user may be liable for copyright infringement.

INTRODUCTION

DATA COLLECTION DESCRIPTION

MONITORING THE FUTURE: A CONTINUING STUDY OF THE LIFESTYLES AND VALUES OF YOUTH, 2016, GRADES 8 AND 10, is conducted by the University of Michigan's Institute for Social Research and receives its core funding under grants from the National Institute on Drug Abuse. (The responsible investigators are: Lloyd D. Johnston, principal investigator; Jerald G. Bachman, Patrick M. O'Malley, John Schulenberg, and Richard A. Miech, co-principal investigators.) The research project is an unusually comprehensive one in several respects: surveys are conducted annually on an ongoing basis; the samples are large and nationally representative; results may be compared with those from other age groups also surveyed annually by the project; and the subject matter is very broad, encompassing altogether approximately 500 variables per year.

The Monitoring the Future Project is designed to explore changes in many important values, behaviors, and lifestyle orientations of contemporary American youth. Two general types of tasks may be distinguished. The first is to provide a systematic and accurate description of the youth population of interest in a given year, and to quantify the direction and rate of the changes taking place among them over time. The second task, more analytic than descriptive, involves the explanation of the relationships and trends observed to exist.

DATA COLLECTION PROCEDURES

The basic research design involves annual data collections from eighth, tenth, and twelfth graders during the spring of each year. Procedures for the twelfth grade data collection are explained in detail elsewhere (1,2); the eighth and tenth grade samples were added in 1991 after 16 years of annual twelfth grade surveys and closely parallel those used for the high school seniors. On average 150 schools are sampled for the eighth grade survey, and approximately 15,000 to 19,000 students are surveyed. For the tenth graders, about 130 high schools are sampled, and approximately 13,000 to 17,000 students are surveyed. This provides an accurate cross-section of 8th and 10th grade students throughout the coterminous United States.

A major exception to the similarities with the 12th grade surveys is that in the 8th/10th grade surveys only four different questionnaire forms are used (and only two forms from 1991-1996) rather than the six used with seniors. Identical forms are used for both eighth and tenth grades, and for the most part, questionnaire content is drawn from the twelfth-grade questionnaires. Thus, key demographic variables and measures of drug use and related attitudes and beliefs are generally identical for all three grades. However, many fewer questions about lifestyles and values are included in the 8th/10th grade forms, in part because the authors believe that many of these attitudes are likely to be more fully formed by twelfth grade and, therefore, are best monitored there.

A limitation to the study design is that two segments of the entire age-cohort are missing: those who are enrolled in school, but are absent on the day of data collection ("absentees"), and those who have dropped out of school ("dropouts").

Dropout rates are relatively low for 8th and 10th graders: dropouts are probably less than 2% in 8th grade, and less than 5% by 10th grade (1). Absentees comprise 9% of eighth graders and about 14% of tenth graders in 2011. Although absentees are likely to be somewhat different from non-absentees on a variety of dimensions, adjusting for their relatively small proportions would have only very modest

effects on population estimates. See the latest annual report for a more extended discussion of this issue (1).

SAMPLING INFORMATION

The procedure for securing nationally representative samples of eighth and tenth graders in public and private schools is a multistage one. Stage 1 is the selection of particular geographic areas, Stage 2 is the selection of one or more schools in each area, and Stage 3 is the selection of students within each school.

Stage 1: Geographic Areas. The geographic areas used in this study are the primary sampling units (PSUs) developed by the Sampling Section of the Survey Research Center for use in the Center's nationwide interview studies. Because these same PSUs are used for personal interview studies by the Survey Research Center (SRC), local field representatives can be assigned to administer the data collections in practically all schools.

Stage 2: Schools. In the major metropolitan areas more than one school is often included in the sampling design; in most other sampling areas a single school is sampled. In all cases, the selections of schools are made such that the probability of drawing a school is proportionate to the size of its eighth or tenth grade class. When a sampled school is unwilling to participate, a replacement school as similar to it as possible is selected from the same geographic area.

Stage 3: Students. Within each selected school, up to about 350 students may be included in the data collection. In schools with fewer than 350 students, we attempt to include all of them in the data collection. In larger schools, a subset of students is selected either by randomly sampling classrooms or by some other random method that is convenient for the school and judged to be unbiased. A sampling weight is assigned to each respondent so as to take account of variations in the sizes of samples from one school to another, as well as the variations in selection probabilities occurring at the earlier stages of sampling. For a table of the sample size and student response rates see Appendix B.

One other important feature of the base-year sampling procedure should be noted here. All schools (except for half of the initial 1991 sample) are asked to participate in two data collections, thereby permitting replacement of half of the total sample of schools each year. One motivation for requesting that schools participate for two years is administrative efficiency; it is a costly and time-consuming procedure to secure the cooperation of schools, and a two-year period of participation cuts down that effort substantially. Another important advantage is that whenever an appreciable shift in scores from one class to the next is observed, it is possible to check whether that shift may be attributable to some differences in the newly sampled schools. This is done simply by repeating the analysis using only the schools which participated both years. Thus far, the half-sample approach has worked quite well and examination of drug prevalence data from the "matched half-samples" showed that the half samples of repeat schools yielded drug prevalence trends which were virtually identical to trends based on all schools.

School Recruiting Procedures. Early during the fall semester an initial contact is made with each sampled school. First a letter is sent to the principal describing the study and requesting permission to survey students. The letter is followed by a telephone call from a project staff member, who attempts to deal with any questions or problems and (when necessary) makes arrangements to contact and seek the permission from other school district officials. Basically the same procedures are followed for schools asked to participate for the second year.

Once the school's agreement to participate is obtained, arrangements are made by phone for administering the questionnaires. A local SRC representative is assigned to work with the school to set a mutually agreeable date for the survey and to carry out the administration.

Advance Contact with Teachers and Students. The local SRC representative is instructed to visit the school two weeks ahead of the actual date of administration. This visit serves as an occasion to meet the teachers whose classes will be affected and to provide them with a brochure describing the study, a brief set of guidelines about the questionnaire administration, and a supply of flyers to be distributed to the students a week to 10 days in advance of the questionnaire administration. The guidelines to the teachers include a suggested announcement to students at the time the flyers are distributed.

From the students' standpoint, the first information about the study usually consists of the teacher's announcement and the short descriptive flyer. In announcing the study, the teachers are asked to stress that the questionnaires used in the survey are not tests, and that there are no right or wrong answers. The flyer tells the students that they will be invited to participate in the study, points out that their participation is strictly voluntary, and stresses confidentiality (including a reference to that fact that the Monitoring the Future project has a special government grant of confidentiality which allows their answers to be protected). The flyer also serves as an informative document which the students can show to their parents. Parental consent involves, at a minimum, the school mailing a letter describing the study and a copy of the student flyer to the parents. The letter provides parents with an easy way to decline their child's participation, if they so wish. Active consent procedures are used when the school or district requires them.

Questionnaire Administration. The questionnaire administration in each school is carried out by the local SRC representatives and their assistants, following standardized procedures detailed in a project instruction manual. The questionnaires are administered in classrooms during normal class periods whenever possible, although circumstances in some schools require the use of larger group administrations. Teachers are not asked to do anything more than introduce the SRC staff members and (in most cases) remain in the classroom to help guarantee an orderly atmosphere for the survey. Teachers are urged to avoid walking around the room, so that students may feel free to write their answers without fear of being observed.

The actual process of completing the questionnaires is quite straightforward. Respondents are given sharpened pencils and asked to use them because the questionnaires are designed for automated scanning. Most respondents can finish within a 45 minute class period; for those who cannot, an effort is made to provide a few minutes of additional time.

Procedures for Protecting Confidentiality. In any study that relies on voluntary reporting of drug use or other illegal acts, it is essential to develop procedures which guarantee the confidentiality of such reports. It is also desirable that these procedures be described adequately to respondents so that they are comfortable about providing honest answers.

The first information given to students about the survey consists of a descriptive flyer stressing the confidentiality and voluntary participation. This theme is repeated at the start of the questionnaire administration. Each participating student is instructed to read the message on the cover of the questionnaire, which stresses the importance and value of the study, notes that answers will be kept strictly confidential, states that the study is completely voluntary, and tells the student "If there is any question you or your parents would find objectionable for any reason, just leave it blank." From 1991 to 1998, the instructions pointed out that in a few months a summary of nationwide results will be mailed to all participants and also that a follow-up questionnaire will be sent to some students after a year. The

cover message explained that these are the reasons for asking that name and address be written on a special form which was removed from the questionnaire and handed in separately. The message also pointed out that the two different code numbers (one on the questionnaire and one on the tear-out form) cannot be matched except by a special computer file at the University of Michigan.

The research design originally called for mail-out follow-up surveys of samples of the eighth and tenth graders participating in the study, carried out at two-year intervals similar to the twelfth grade follow-up samples. In 1997, it was decided to discontinue follow-up surveys; consequently, the original "confidential" procedures (in which names and addresses were obtained from all respondents) were changed to anonymous procedures (in which no names or addresses were obtained). To allow an assessment of the potential effect of the different procedures, half the schools (all those participating for a second year) were assigned to the confidential procedure in 1998, and half (all those participating in their first year) to the anonymous condition. Beginning in 1999, all eighth and tenth grade surveys were anonymous. Analyses showed that this change in procedure had no effect on the reporting of sensitive information (i.e. drug use) by tenth graders, and little or no effect on eighth graders (3).

In order to protect the confidentiality of responses and the identity of respondents, a number of alterations have been made in the original dataset to prepare it for public release; these alterations are described later in the section "Processing Information."

CONTENT AREAS AND QUESTIONNAIRE DESIGN

Drug use and related attitudes are the topics which receive the most extensive coverage in the Monitoring the Future project; but the 8th/10th grade questionnaires also deal with a wide range of other subject areas, including educational aspirations, occupational aims, and marital and family plans, as well as a variety of background and demographic factors. These are listed below, along with their associated code letters by which all questions are organized in a cross-time index provided in the User Guide for this collection. The same code letters have been assigned to each area as were used in the twelfth grade content index. Because not all of the areas covered in twelfth grade are included in grades 8/10, some letters in the sequence are missing here.

MEASUREMENT CONTENT AREAS

A.	<i>Drugs. Drug use and related attitudes and beliefs, drug availability and exposure, surrounding conditions and social meaning of drug use. Views of significant others regarding drugs.</i>
B.	<i>Education. Educational lifestyle, values, experiences, and environments. Media usage.</i>
C.	<i>Work and Leisure. Vocational values, meaning of work and leisure, work and leisure activities including computer use, preferences regarding occupational characteristics and type of work setting.</i>
D.	<i>Gender Roles and Family. Values, attitudes, and expectations about marriage, family structure, sex roles, and gender discrimination.</i>
E.	<i>Population Concerns. Values, attitudes, and expectations about personal family plans. Concerns about overpopulation. Educational opportunities offered concerning family planning.</i>
F.	<i>Conservation, Materialism, Equity, etc. Values, attitudes, and expectations related to conservation, pollution, materialism, equity, and the sharing of resources. Preferences regarding type of dwelling and urbanicity.</i>
G.	<i>Religion. Religious affiliation, practices, and views.</i>
I.	<i>Social Change. Values, attitudes, and expectations about social change.</i>
J.	<i>Social Problems. Interest and Concerns.</i>
L.	<i>Military. Personal plans for military service. Views about the armed services and the use of military force.</i>
M.	<i>Interpersonal Relationships. Qualitative and quantitative characteristics of cross-age and peer relationships. Interpersonal conflict.</i>
O.	<i>Concern for Others. Radius of concern for others; voluntary and charitable activities.</i>
P.	<i>Happiness. Happiness and life satisfaction, overall and in specific life domains.</i>
Q.	<i>Other Personality Variables. Attitudes about self (including self-esteem), locus of control, loneliness, boredom, risk-taking, optimism, trust in others, importance placed on various life goals.</i>
R.	<i>Background and School. Demographic and family background characteristics, curriculum and grades in school, victimization in school.</i>
S.	<i>Deviant Behavior and Victimization. Delinquent behaviors, seatbelt use, victimization experiences.</i>
T.	<i>Health habits and symptoms, height and weight, illness, medical treatment.</i>

Given this breadth and depth of content, the study is not presented to respondents as a “drug use study,” nor do they tend to view it as such.

Because many questions are needed to cover all of these topic areas, much of the questionnaire content is divided into two (1991-1996) to four (1997 on) different questionnaire forms. *In 1997, the third and fourth questionnaire forms were added to allow for new questions to be included in the survey.* The questionnaires are distributed to participants in an ordered sequence. In 1991-1996, this produced two equivalent half-samples. Beginning in 1997, four forms were used: forms 1 and 2 were distributed to a random 33.3% (1/3) of students, and forms 3 and 4 were distributed to a random 16.7% (1/6) of students. Thus, a question could be answered by 1/6, 1/3, 1/2, 2/3, 5/6, or all of the sample, depending on which forms included that question.

Over one-third of each questionnaire form consists of key or “core” variables which are common to all forms. All demographic variables and some measures of drug use are included in this “core” set of

measures. This use of the full sample for drug and demographic measures provides a more accurate estimation on these dimensions and also makes it possible to link them statistically to all the other measures which are included in a single form only.

REPRESENTATIVENESS AND VALIDITY

The samples for this study are intended to be representative of eighth and tenth grade students attending private or public schools throughout the 48 contiguous states. It is useful to consider the extent to which the obtained samples of schools and students are likely to be representative of all eighth and tenth graders, and the degree to which the data obtained are likely to be valid.

It is possible to distinguish at least four ways in which survey data of this sort might fall short of being fully representative. First, some sample schools refuse to participate, which could introduce some bias. Second, the failure to obtain questionnaire data from 100 percent of the students sampled in participating schools would also introduce bias. Third, the answers provided by participating students are open to both conscious and unconscious distortions which could reduce validity. Finally, limitations in sample size and/or design could place limits on the accuracy of estimates.

School Participation. As noted in the description of the sampling design, schools are invited to participate in the study for a two-year period. (With very few exceptions, each school which has participated for one data collection has agreed to participate for a second.) When an invited school declines to participate, a similar school (in terms of size, geographic area, urbanicity, etc.) is recruited as a replacement. The selection of replacement schools almost entirely removes problems of bias in region, urbanicity, and the like that might result from certain schools refusing to participate. Other potential biases are more subtle, however. For example, if it turned out that most schools with "drug problems" refused to participate, that would seriously bias the drug estimates derived from the sample. And if any other single factor were dominant in most refusals, that also might suggest a source of serious bias. In fact, however, the reasons for schools' refusals to participate are varied and largely a function of happenstance events of the particular year. Thus, the investigators feel confident that school refusals have not seriously biased the surveys.

Student Participation. Completed questionnaires are obtained from between 85% and 91% of all 8th and 10th graders sampled. The single most important reason that students are missed is that they are absent from class at the time of the data collection, and in most cases it is not workable to schedule a special follow-up data collection for them. Students with fairly high rates of absenteeism also report above-average rates of drug use; therefore, there is some degree of bias introduced by missing the absences. That bias could be corrected through the use of special weighting; however, this course was not chosen because the bias in estimates (in drug use, where the potential effect was hypothesized to be largest) was determined to be quite small and because the necessary weighting procedures would have introduced undesirable complications. Of course, some students refuse to complete or turn in a questionnaire, either on their own or because their parents refused consent. However, SRC representatives in the field estimate this proportion to be about two percent of the eligible 8th and 10th graders.

Validity of Self-Report Data. Survey measures of delinquency and of drug use depend upon respondents reporting what are, in many cases, illegal acts. Thus, a critical question is whether such self-reports are likely to be valid. Like most studies dealing with these areas, the present study does not include direct, objective validation of the present measures; however, the considerable amount of inferential evidence which exists strongly suggest that the self-report questions produce largely valid data. A number of factors have given the investigators reasonable confidence about the validity of the

responses to what are presumably among the most sensitive questions in the study: a low non-response rate on the drug questions; a large proportion admitting to some illicit drug use; the consistency of findings across several years of the present study; strong evidence of construct validity (based on relationships observed between variables); a close match between these data and the findings from other studies using other methods; and the findings from several methodological studies which have used objective validation methods.

As for others of the measures, a few have a long and venerable history – as scholars of the relevant literature will recognize – though some of these measures have been modified to fit the present questionnaire format. Many questions, however, have been developed specifically for this project through a process of question writing, pilot testing, pretesting, and question revision or elimination.

Accuracy of the Sample. A sample survey never can provide the same level of accuracy as would be obtained if the entire target population were to participate in the survey. But perfect accuracy of this sort would be extremely expensive and certainly not worthwhile considering the fact that a high level of accuracy can be provided by a carefully designed probability sample. The accuracy of the sample in this study is affected both by the size of the student sample and by the number of schools in which they were clustered. For the purposes of this introduction, it is sufficient to note that virtually all estimates based on the total samples of both grades have confidence intervals of 2.0% -- sometimes considerably smaller. This means that, had the project been able to invite all schools and all eighth or tenth graders in the 48 contiguous states to participate, the results from such a massive survey would be within an estimated 2.0 percentage points from the present sample findings 95 times out of 100. This is a quite high level of accuracy, and one that permits the detection of fairly small trends from one year to the next.

Because of the complex sampling design, standard means of assessing confidence intervals are not appropriate. The [annual volumes](#) from the project provide information which allows the analyst to determine the confidence intervals around means and percentages for both the total sample and various subgroups. They also provide tables and guidelines for testing the statistical significance of differences between subgroups, and the significance of year-to-year changes (1).

Consistency and the Measurement of Trends. One other point is worth noting in a discussion of the validity of the findings. The Monitoring the Future project is, by intention, a study designed to be sensitive to changes from one time to another. Accordingly, the measures and procedures have been standardized and applied consistently across each data collection. To the extent that any biases remain because of limits in school and/or student participation, and to the extent that there are distortions (lack of validity) in the responses of some students, it seems very likely that such problems will exist in much the same way from one year to the next. In other words, biases in the survey estimates should tend to be consistent from one year to another, which means that the measurement of trends should be affected very little by such biases.

Interpreting racial differences. Until 2005, ethnic identification was provided for the two largest racial/ethnic subgroups in the population -- those who identified themselves as white or Caucasian and those who identified themselves as black or African American. Identification was not given for the other ethnic categories (Native Americans, Asian Americans, Mexican Americans, Puerto Rican Americans, or other Latin Americans) since each of these groups comprised a small proportion of the sample in any given year, which means that their small Ns (in combination with their clustered groupings in a limited number of schools) would yield estimates which would be too unreliable. Because of increases in the number of those who identify themselves as one of the Hispanic groups, we now include identification for this category.

However, the analyst should bear in mind that African Americans and Hispanics -- each of whom constitute approximately 9 to 15 percent of the sample -- may be represented by only 700 respondents per year on any single questionnaire form. After 1996 when two more forms were added, the number of Hispanic or Black respondents available in the dataset can drop to below 300. Further, because our sample is a stratified clustered sample, it yields less accuracy than would be yielded by a pure random sample of equal size (see Appendix C of the [annual volumes](#) for details). Therefore, because of the limited number of cases, the margin of sampling error around any statistic describing African Americans or Hispanics is larger than for most other subgroups.

There exists, however, a way to determine the replicability of any finding involving racial comparisons. Since most questions are repeated from year to year, one can readily establish the degree to which a finding is replicated by looking at the results in prior and subsequent years. Given the relatively small Ns for minority groups, the analyst is urged to seek such replication before putting much faith in the reliability of any particular racial comparison.

There are factors in addition to reliability, however, which could be misleading in the interpretation of racial differences. Given the social importance which has been placed on various racial differences reported in the social science literature, the investigators would like to caution the analyst to consider the various factors which could account for differences. These factors fall into three categories: differential representation in the sample, differential response tendencies, and the confounding of race with a number of other background and demographic characteristics. The following discussion is based on analyses that were conducted prior to 2005, when identifiers for Hispanics were not included, so the discussion is specific to African Americans. However, the points made, particularly those about differential representation and confounding of race/ethnicity with other background and demographic characteristics, would be relevant to Hispanics, as well.

Differential Representation. Census data characterizing American young people in the approximate age range of those in this sample show somewhat lower proportions of African Americans than whites remain in school through the end of the twelfth grade.¹ Therefore, a slightly different segment of the African American population than of the white population resides in the target population of high school seniors. It is less clear to what extent there may be differential representation at the 8th and 10th grade levels. It may be that there is very little underrepresentation in 8th grade, because very few students drop out of school before the end of 8th grade; somewhat more, though still relatively few, may drop out by near the end of 10th grade, and that could be differential by race.

Differential Response Tendencies. In examining the full range of variables, racial differences in response tendencies among high school seniors have been noted. First, the tendency to state agreement in response to agree-disagree questions is generally somewhat greater among blacks than among whites. For example, blacks tend to agree more with the positively worded items in the index of self-esteem, but they also tend to agree more with the negatively worded items. As it happens, that particular index has an equal number of positively and negatively worded items, so that any overall "agreement bias" should be self-canceling when the index is computed. However, group differences in agreement bias are likely to affect results on questions employing the agree-disagree format. Fortunately, most of the questions are not of that type.

There has also been observed a somewhat greater than average tendency for African American respondents to select extreme answer categories on attitudinal scales. For example, even if the same proportion of African Americans as whites felt positively (or negatively) about some subject, fewer of the

¹ The Hispanic group has considerably higher dropout rates than either whites or blacks, which means that student samples become increasingly less representative of the entire age group at higher grades.

whites are likely to say they feel very positively (or negatively). The analyst should be aware that differences in responses to particular questions may be related to these more general tendencies.

A somewhat separate issue in response tendency is a respondent's willingness to answer particular questions. The missing data rate may be an indication of that unwillingness. If a particular question or set of questions has a missing data rate higher than is true for the prior or subsequent questions, then presumably more respondents than usual were unwilling (or perhaps unable) to answer it. Such an exaggerated missing data rate has been found for African American male seniors on the set of questions dealing with the respondent's own use of illicit drugs. Clearly a respondent's willingness to be candid on such questions depends on his or her trust of the research process and of the researchers themselves. The exaggerated missing data rates for African American males in these sections may reflect, at least in part, less trust. The analyst is advised to check for exceptional levels of missing data when making comparisons on any variable in which candor is likely to be reduced by lower system trust. One bit of additional evidence related to trust in the research process is that higher proportions of African Americans seniors than white seniors reported that if they had used marijuana or heroin they would not have been willing to report it in the survey.

Covariance with Other Factors. Some characteristics such as race are highly confounded (correlated) with other variables – variables which may in fact explain some observed racial differences. Put another way, at the aggregate level we might observe a considerable racial difference on some characteristic, but once we control for some background characteristic such as socioeconomic level or region of the country – that is, once we compare the African American respondents with whites who come from similar backgrounds – there may be no racial difference at all.

Race is correlated with important background and demographic variables. A higher proportion of African Americans live in the South and a higher proportion grew up in families with the mother and/or father absent, and more had mothers who worked while they were growing up. A substantially higher proportion of African Americans are Baptists, and African Americans tend to attribute more importance to religion than do whites.

These differences in background, demographic, and ascriptive characteristics are noted because, in any attempt to understand why a racial difference exists, one would want to be able to examine the role of these covarying characteristics.

WEIGHTING INFORMATION

Frequency and percentage distributions displayed in codebooks produced after 2007 are unweighted, rather than weighted by variable V5 as they had been in previous years. This change was made to simplify both the production of the codebooks and their interpretation by the analyst.

FILE STRUCTURE

MONITORING THE FUTURE: A CONTINUING STUDY OF AMERICAN YOUTH (8TH-AND 10TH-GRADE SURVEYS), 2016 is available from ICPSR in one logical record length dataset. Beginning in 2012, the 8th and 10th grade data, which uses four separate questionnaires, has been combined into one data set. The data are sorted by case. The datasets are organized by subject area. For each part, the data are also available from ICPSR in the following formats: SAS transport (CPORT) file, SPSS system file, and Stata system file, with SAS and Stata supplemental syntax files, and a tab-delimited ASCII text file. The SAS, SPSS, and Stata data definition statements give the format and other information for each variable in the data file. The data file is constructed with a single logical record for each case.

PROCESSING INFORMATION

The data collection was processed according to the standard ICPSR processing procedures. The data were checked for illegal or inconsistent code values which, when found, were recoded to missing data values. Consistency checks were performed.

For reasons of confidentiality, the weight variable (V5) was altered from its original version to a modified version prior to public distribution of the data. THIS RESULTS IN SLIGHT DISCREPANCIES BETWEEN THE PERCENTAGES AND N SIZES IN THE ANNUAL ISR VOLUMES AND THOSE FROM WEIGHTED ANALYSES OF THE PUBLIC USE DATASETS. Typically, the variation is less than 1%.

In order to protect the confidentiality of responses and the identity of respondents, a number of alterations and omissions have been made in the original dataset to prepare it for public release. Three variables have been included to describe the respondent's general environment without identifying school or state. These are (1) region (Northeast, North Central, South, and West), (2) whether or not the school is located in a Metropolitan Statistical Area (MSA), and (3) whether or not the school is located in a Large MSA. Some questions have been eliminated altogether; others are collapsed to mask groups which are very small. The following table lists the question numbers and names of the variables which have been excluded from each eighth and tenth grade dataset.

Omitted Variables:

Forms 1 to 4	C01. R'S BIRTH YEAR
Forms 1 to 4	C02 R'S BIRTH MONTH
Forms 1 to 4	C05. FIRST LANGUAGE
Forms 1 to 4	C07e-h. R'S HSHLD (other than mother/father/sibling)
Forms 1 to 4	C12a. R'S RELGS PRFNC
Form 1	A12. CURRENT HEIGHT
Form 1	A13. CURRENT WEIGHT
Form 2	E03. CURRENT HEIGHT
Form 2	E04. CURRENT WEIGHT
Form 2	E07 ZIP CODE (5 DIGIT)
Form 4	E02. CURRENT HEIGHT
Form 4	E03. CURRENT WEIGHT
Form 4	E05 ZIP CODE (5 DIGIT)

Recoded Variables:

The variables that have been retained but altered to insure confidentiality follow.

Forms 1-4 R'S ID - SERIAL

5 digit code exclusive to each grade; modified to protect respondent confidentiality

Forms 1-4 Sampling Weight

Originally varied by school but modified to protect respondent confidentiality; use for all analyses, results of which will differ slightly from published data tables using original data.

AGE <> 16 DICHOTOMY (10th grade only):

1=younger than 16 years old,

2=16 years old or more

-9=missing data on birth year, or birth month if it is required

Derived from Q.C01 (Birth Year), and, if needed, Q.C02 (Birth Month), and the month that the questionnaire was administered. If the birth year value indicates that the respondent is 16, then the month of administration is compared to the month of birth. If the questionnaire was given before the month of birth, or if both were the same month, then the respondent is determined to be younger than 16.

R'S RACE B/W/H

1=BLACK, 2=WHITE, 3=HISPANIC -9>All Other Codes and missing data or multiple recode results on items 00041-00049.

The race question series lists several different response options and prompts the respondents to select all that apply to them. In cases where a respondent selected options which fell into more than one of the three recoded categories (Black, White, Hispanic), the value for the recoded variable was deleted and defined as missing.

C07a-c. R'S HSHLD FATHER, MOTHER, SIBLING

0=marked, 1=not marked, -9=none of the three items marked

Sibling combines responses to originally separate questions about brother and sister, then after these and the remaining "HSHLD" items were deleted, missing data on C07a, b, and new c was redetermined.

C22. EVER HELD BACK

Dichotomized to 0=NO, 1=YES, -9=missing

C23. NEED SUMMER SCHL

Dichotomized to 0=NO, 1=YES, -9=missing

C24. EVER SUSPENDED

Dichotomized to 0=NO, 1=YES, -9=missing

Missing Data for Western Region:

Beginning in 1997, a select group of questions were excluded from some schools in the Western region, rendering those schools potentially identifiable. Thus, these variables were intentionally changed to missing data (coded -9) from all schools in the Western region of the contiguous United States:

Monitoring the Future: A Continuing Study of American Youth (8th- and 10th-Grade Surveys), 2016

Variable Description and Frequencies

Note: Frequencies displayed for the variables are not weighted. They are purely descriptive and may not be representative of the study population. Please review any sampling or weighting information available with the study.

Summary statistics (minimum, maximum, mean, median, and standard deviation) may not be available for every variable in the codebook. Conversely, a listing of frequencies in table format may not be present for every variable in the codebook either. However, all variables in the dataset are present and display sufficient information about each variable. These decisions are made intentionally and are at the discretion of the archive producing this codebook.

CASEID: CASE IDENTIFICATION NUMBER

Item number: 00860 F1234

The next major section of this questionnaire deals with various other drugs. There is a lot of talk these days about this subject, but not enough accurate information. Therefore, we still have a lot to learn about the actual experiences and attitudes of people your age. We hope that you can answer all questions, but if you find one which you feel you cannot answer honestly, we would prefer that you leave it blank. Remember that your answers will be kept strictly confidential; they are never connected with your name or your class.

On how many occasions (if any) have you used marijuana (weed, pot) or hashish (hash, hash oil) . . . in your lifetime?

1="0 Occasions" 2="1-2 Occasions" 3="3-5 Occasions" 4="6-9 Occasions" 5="10-19 Occasions" 6="20-39 Occasions"

Item number: 31460 F1!

The next questions are about drugs that doctors sometimes prescribe for people who have problems concentrating on one task at a time (attention deficit disorder), or with being too active or too disruptive (hyperactive), or both (ADHD). Stimulant-type drugs (i.e., amphetamine, methylphenidate, and pemoline) are prescribed for these conditions. These drugs include Ritalin, Adderall, Concerta, Metadate, Dexedrine, Focalin, Cylert, and others.

Have you ever taken any of these stimulant-type prescription drugs under a doctor's supervision for these conditions? (Do not count drugs that are not stimulant-type, like Straterra, Wellbutrin, Provigil, Tenex, Intuniv, or Catapres)

The next major section of this questionnaire deals with various other drugs. There is a lot of talk these days about this subject, but not enough accurate information. Therefore, we still have a lot to learn about the actual experiences and attitudes of people your age. We hope that you can answer all questions, but if you find one which you feel you cannot answer honestly, we would prefer that you leave it blank. Remember that your answers will be kept strictly confidential; they are never connected with your name or your class.

V7127D: 2016 A01a #X AMPH/LIFETIME F12!34! (dicotomous recode)

Amphetamines [and other stimulant drugs] are sometimes prescribed by doctors for people who have trouble paying attention, are hyperactive, have ADHD, or have trouble staying awake. They are sometimes called uppers, ups, pep pills, and include drugs like Adderall and Ritalin. Drugstores are not supposed to sell them without a prescription from a doctor. Amphetamines do NOT include any nonprescription drugs, such as over-the-counter diet pills or stay-aware pills. On how many occasions (if any) have you taken amphetamines [or other prescription stimulant drugs] on your own -- that is, without a doctor telling you to take them . . . in your lifetime?

[Variable recoded by ICPSR. Original variable recoded (1 = 0) (2 thru 7 = 1) (-9 = -9)].

APPENDIX

APPENDIX A: PUBLICATIONS

In previous years, Monitoring the Future Publications were listed as Appendix A to this document.

For a current list of publications referencing Monitoring the Future data, please visit the Monitoring the Future [Publications](#) web page.

Publications are divided into the following categories:

- Monographs
- Reference Volumes
- Books
- Journal Articles
- Chapters
- Research Reports
- Occasional Papers
- Congressional Testimony
- Publications by Study Staff

Many of the publications may be accessed electronically via the web site, either in their entirety and/or in abstract form.

APPENDIX B: SAMPLE SIZE AND STUDENT RESPONSE RATES

The three-stage sample procedure described in the introduction yielded the following number of participating schools and students.

Grade:	Number of <u>Public Schools</u>		Number of <u>Private Schools</u>		Total Number <u>of Schools</u>		Total Number <u>of Students</u>		Student <u>Response Rate</u>	
	<u>8th</u>	<u>10th</u>	<u>8th</u>	<u>10th</u>	<u>8th</u>	<u>10th</u>	<u>8th</u>	<u>10th</u>	<u>8th</u>	<u>10th</u>
1991	131	107	31	14	162	121	17,844	14,996	90	87
